

SPL Compiler

Type A completeness

This is a simple SPL compiler that generates executable BASIC code from SPL source files.

Directory Structure

Ensure your project has the following structure:

```
Input/  
    program1.txt  
    program2.txt  
Compiler.jar
```

- Place all your SPL source files in the **Input** directory.
- The compiler jar (**Compiler.jar**) should be in the same root directory as **Input/**.

Running the Compiler

Run the compiler using:

```
java -jar Compiler.jar
```

You will be presented with a list of available SPL files in the **Input** directory.

- Enter the **number** corresponding to the file you want to compile.

Output

- The generated BASIC code will be saved in:

```
Output/<InputFileName>/<InputFileName>.txt
```

- The Intermediatecode.html will be saved in:

```
Output/<InputFileName>/<InputFileName>.html
```

For example, compiling **program1.txt** will produce:

```
Output/program1/program1.txt
```

```
Output/program1/program1.html
```

- The **Output** directory will be created automatically if it doesn't exist.
- You can then view the intermediate code in a browser and run the basic code in a basic compiler -> We used <https://www.calormen.com/jsbasic/> and bwbasic (linux program) to test the output code.
